CookBook: Your Virtual Kitchen Assistant

(ReactApplication)

Introduction:

CookBook is a revolutionary web application designed to change the way you discover, organize, and createrecipes. It caters to both novice and professional chefs, offering auser-friendly interface, robust features, and a vast collection of inspiring recipes.

Description:

WelcometotheforefrontofculinaryexplorationwithCookBook!

Our cutting-edge web application is meticulously crafted to transcend the boundaries of culinary experiences, catering to the tastes of both passionate cooking enthusiasts, and seasoned professional chefs. With an emphasis on an intuitive user interface and a robust feature set, CookBookispoisedtorevolutionizetheentirerecipediscovery,organization,and creation process.

Designed with a commitment to user-friendly aesthetics, CookBook immerses users in an unparalleled culinary adventure. Navigate seamlessly through a vast expanse of culinary inspiration with features such as dynamic search effortlessly.

From those taking their first steps in the kitchen to seasoned professionals, CookBook embraces a diverse audience, nurturingadynamiccommunityunitedbyasharedpassionfor the art of cooking. Our vision is to reshape how users interact with recipes, presenting a platform that not onlysparksinspirationbutalsofosterscollaborationandsharingwithinthe vibrant culinary community.

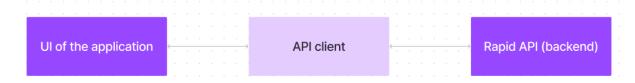

Embark on this gastronomic journey with us, where innovation seamlessly intertwines with tradition. Every click within CookBook propels you closer toarealmofdeliciouspossibilities. Join us and experience the evolution of recipe management, where each feature is meticulously crafted to offer a glimpse into the future of culinary exploration. Elevate your culinary endeavourswithCookBook,whereeveryrecipebecomesanadventurewaitingtobe discovered and savoured.

Scenariobasedintroduction:

Sarah rummaged through the fridge, the fluorescent light casting an unappetizing glow on the wilting lettuce and forgotten container of yogurt. Dinnertime with her teenage son, Ethan, was fast approaching, and her usual creative spark was missing. "What are we even going to eat?" Ethan groaned from the doorway, his phone glued to his ear. Suddenly, a memory surfaced. Her friend, Maya, had been raving about a new recipe platform called CookBook. Intrigued by the promise of "elevating culinary endeavors" and "are almof

deliciouspossibilities, "Sarahgrabbedherlaptop." Holdthatthought, Ethan, "shedeclared, a flicker of hope igniting in her eyes. "We might just be about to embark on a delicious adventure."

TechnicalArchitecture:

The user experience starts with the CookBooks web application's UI, likely builtwithaframeworklike React or Vue.js for a smooth, single-page experience. This UI interacts with an API client specifically designed for CookBooks. This client handles communication with the backend, but with a twist: it leverages Rapid API, a platform providing access to various external APIs. This suggests CookBooks might integrate external data feedsorfunctionalitiesthroughRapidAPI,enrichingtheuserexperience without building everything from scratch.

ProjectGoalsandObjectives:

The primary goal of CookBook istoprovideauser-friendlyplatformthatcaterstoindividuals passionate about cooking, baking, and exploring new culinary horizons. Our objectives include:

- **User-FriendlyExperience:**Createaninterfacethatiseasytonavigate,ensuringusers can effortlessly discover, save, and share their favourite recipes.
- **ComprehensiveRecipeManagement:**Offerrobustfeaturesfororganizing and managing recipes, including advanced search options.
- **TechnologyStack**:Leveragemodernwebdevelopmenttechnologies,includingReact.js, to ensure an efficient, and enjoyable user experience.

FeaturesofCookBooks:

- √ RecipesfromtheMealsDBAPI: Accessavastlibraryofinternational recipes spanning diverse cuisines and dietary needs.
- ✓ **Visualrecipebrowsing:**Explorerecipecategories and discovernew dishest hrough curated image galleries.

- ✓ **Intuitiveanduser-friendlydesign:**Navigatetheappeffortlesslywithaclean,modern interface and clear navigation.
- ✓ **Searchfeature:**various dishes can be accessed easily through the search feature.

PRE-REQUISITES:

Herearethekeyprerequisitesfordevelopingafrontendapplicationusing React.js:

√ Node.js and npm:

Node.js is a powerful JavaScript runtime environment that allows you to run JavaScript code on thelocalenvironment.Itprovidesascalableandefficientplatform for building network applications.

InstallNode.jsandnpmonyourdevelopmentmachine,astheyarerequiredtorun JavaScript on the server-side.

- Download: https://nodejs.org/en/download/
- Installationinstructions: https://nodejs.org/en/download/package-manager/

✓ React.js:

React.js is a popular JavaScript library for building user interfaces. It enables developers to create interactive and reusable UI components, making it easier to builddynamic and responsive web applications.

InstallReact.js,aJavaScriptlibraryforbuildinguserinterfaces.

CreateanewReact app:

```
npx create-react-app my-react-app Replacemy-react-appwithyourpreferredprojectname.
```

Navigatetotheprojectdirectory:

```
cd my-react-app
```

RunningtheReactApp:

WiththeReactappcreated, you cannow start the developments erver and seeyour React application in action.

• Startthedevelopmentserver:

npm start

This command aunches the developments erver, and you can access your React app at http://localhost:3000 in your web browser.

- √ HTML,CSS,andJavaScript:BasicknowledgeofHTMLforcreatingthestructureof yourapp, CSS for styling, and JavaScript for client-side interactivity is essential.
- ✓ DevelopmentEnvironment:ChooseacodeeditororIntegratedDevelopment Environment (IDE) that suits your preferences, such as Visual Studio Code, SublimeText, or WebStorm.
 - Visual Studio Code: Download from https://code.visualstudio.com/download • SublimeText: Download from https://www.sublimetext.com/download
 - WebStorm:Downloadfromhttps://www.jetbrains.com/webstorm/download

TocloneandruntheApplicationprojectfromGoogledrive: Follow

below steps:

√ Getthecode:

• Downloadthecodefromthedrivelinkgivenbelow:

https://drive.google.com/drive/folders/1u8PnV mE0mwKkH CvuNpliZtRLJZMqrO?usp=sharing

InstallDependencies:

• Navigateintotheclonedrepositorydirectoryandinstalllibraries:

cd recipe-app-react

npm install

√ StarttheDevelopmentServer:

• Tostartthedevelopmentserver, execute the following command:

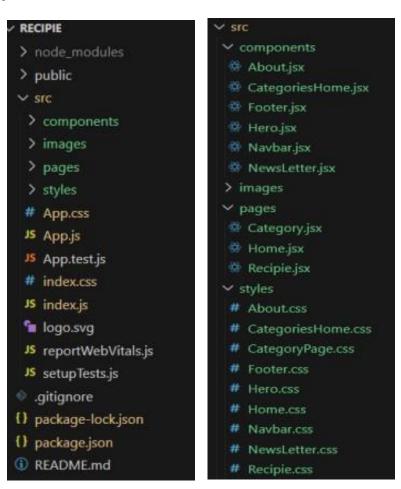

npm start

Access the App:

- Openyourwebbrowserandnavigateto http://localhost:3000.
- Youshouldseetherecipeapp'shomepage,indicatingthattheinstallation and setup were successful.

Youhavesuccessfullyinstalledandsetuptheapplicationonyourlocalmachine. Youcan now proceed with further customization, development, and testing as needed.

Projectstructure:

In this project, we've split the files into 3 major folders, Components, Pages and Styles. In the

pages folder, we store the files that acts as pages at different url's in the application. The components folder stores all the files, that returns the small components in theapplication. All the styling css files will be stored in the styles folder.

ProjectFlow:

Projectdemo:

Beforestartingtoworkonthisproject, let's see the demo.

Milestone1:Projectsetupandconfiguration.

• Installationofrequiredtools:

To buildCookBook,we'llneedadeveloper'stoolkit.We'lluseReact.jsfortheinteractive interface, React Router Dom for seamless navigation, and Axios to fetch news data.Forvisual design, we'll choose either Bootstrap or Tailwind CSS for pre-built styles and icons.

Opentheprojectfoldertoinstallnecessarytools,Inthisproject,weuse:

- React Js
- ReactRouterDom
- ReactIcons
- Bootstrap/tailwindcss
- Axios

• Forfurtherreference, use the following resources

- o https://react.dev/learn/installation
- o https://react-bootstrap-v4.netlify.app/getting-started/introduction/
- o https://axios-http.com/docs/intro
- o https://reactrouter.com/en/main/start/tutorial

Milestone2:ProjectDevelopment

SetuptheRoutingpaths

Setuptheclearroutingpathstoaccessvariousfilesintheapplication.

- DeveloptheNavbarandHero components
- Codethepopularcategoriescomponentsandfetchthecategoriesfrom the meals db Api.
- Also, addthetrending dishes in the home page.
- Now, develop the category page to display various dishes under the category.
- ❖ Finally,codetherecipepage,wheretheingredients,instructionsandademovideo will be integrated to make cooking much easier.

ImportantCodesnips:

> Fetchingalltheavailablecategories

Here, with the API request to Rapid API, we fetch all the available categories.

```
const [categories, setCategories] = React.useState([])

useEffect(() => [
    fetchCategories()
}, [])

const fetchCategories = asymc () => (
    await axios.get('https://www.themealdb.com/api/json/vi/1/categories.php')
    .then(response => {
        setCategories(response.data.categories)
            console.log(response.data.categories)
        })
    .catch(error => console.error(error));
}
```

This code snippet demonstrates how to fetch data from an API and manageit within a React component. It leverages two key functionalities: state management and side effects.

StateManagementwithuseStateHook:

The code utilizes the useState hook to create a state variable named categories. This variable acts as a containertoholdthefetcheddata, whichin this caseisalistofmeal categories. Initially, the categories state variable is set to an empty array [].

FetchingDatawithuseEffectHook:

The useEffect hook is employed to execute a side effect, in this instance, fetching data from an API.Thehooktakesacallbackfunction(fetchCategories in this case) and an optional dependency array. The callback function is invoked after the component renders and whenever the dependencies inthe array change. Here, the dependency array is left empty [], signifying that the data fetching should occur only once after the component mounts.

FetchingDatawithfetchCategoriesFunction:

An asynchronous function named fetchCategories is defined to handletheAPI interaction. This function utilizes the axios.get methodtomakeaGETrequest to a specified API endpoint (https://www.themealdb.com/api/json/vi/1/categories.php in this example). This particular endpoint presumably returns a JSONresponsecontainingalist of meal categories.

ProcessingAPIResponse:

The .then method is chained to the axios.get call to handle a successful response from the API. Inside the .then block, the code retrieves the categories data from the response and updates the React component's state using the setCategories function. This function, associated with the useState hook, allows for modification of the categories state variable. By calling setCategories(response.data.categories), the component's state is updated with the fetched list of meal categories.

> Fetchingthefooditemsunderaparticular category

Now, with the API request, we fetch all the available food items under the certain category.

```
const (id) = useParams();

const [items, setItems] = React.useState([])

useEffect(() => {
    fetchItems(id)
}, [window.location.href])

const fetchItems = usync (idd) => {
    maxit axios.get( https://www.themealdh.com/api/[som/v1/1/filter.php?cos{idd] )
    .then(response => {
        setItems(response.data.meals)
        console.log(response.data.meals)
    })
    .catch(error => console.error(error));
}
```

This React codes nippet manages data fetching from an API.

- ItleveragestheuseStatehooktoestablishastatevariablenamedcategories. This variableacts as a container to hold the fetched data, which is initially set to an empty array [].
- TheuseEffecthookcomesintoplaytoexecuteasideeffect,inthisinstance,fetchingdatafrom an API endpoint. The hook takes a callback function (fetchCategories in this case) and an optional dependency array. The callback function is invoked after the component renders and whenever the dependencies in the array change. Here, the dependency array is left empty [], signifying that the data fetching should occur only once after the component mounts.
- The fetchCategories function is an asynchronous function responsible for handling the API interaction. This function utilizes the axios.get method to make a GET request to a predeterminedAPIendpoint(https://www.themealdb.com/api/json/vi/1/categories.phpinthis example). This particular endpoint presumably returns a JSON response containing a list of meal categories.
- The code snippet employs the .then method, which is chained to the axios.get call, to handle a successfulresponsefromtheAPI.Insidethe.thenblock,thecoderetrievesthecategoriesdata from the response and updates the React component's state using the setCategories function. Thisfunction,associatedwiththeuseStatehook,allowsformodificationofthecategoriesstate variable. By calling setCategories(response.data.categories), the component's state is updated with the fetched list of meal categories.
- An optional error handling mechanism is incorporated using the .catch block. This block is
 designedtomanageanyerrorsthatmightariseduringtheAPIrequest.Ifanerroroccurs,the
 .catch block logs the error details to the console using the console.error method. This
 rudimentaryerrorhandlingmechanismprovidesawaytoidentifyandaddresspotentialissues during
 the data fetching process.

> FetchingRecipedetails

Withtherecipeid, we fetch the details of a certain recipe.

```
const {id} = useParams();
const [recipie, setRecipie] = React.useState()

useEffect(() =>>{
    fetchRecipie()
}, [])

Const fetchRecipie = async () => {
    await axios.get( https://www.themealdb.com/api/json/v1/1/lookup.php?i=$(id) ')
    .then(response => {
        setRecipie(response.data.meals[0])
        console.log(response.data.meals[0])
    })
    .catch(error => console.error(error));
}
```

This React code manages fetching recipedata from an API and storing it within a state variable.

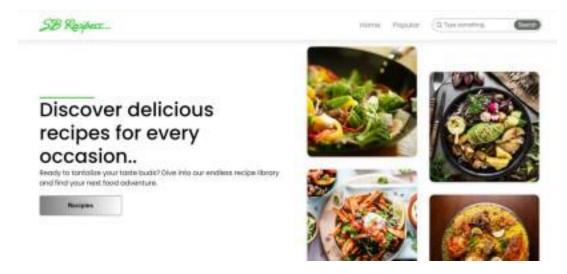

- It leverages the useState hook to establish a state variable named recipie (which is initially empty). This variable acts as a container to hold the fetched recipe data.
- The useEffect hook comes into playtoexecuteasideeffect,inthisinstance,fetchingdatafrom an API endpoint. The hook takes a callback function (fetchRecipie in this case)andanoptional dependency array. Thecallbackfunctionisinvokedafterthecomponentrendersandwhenever the dependencies in the array change. Here, the dependency array is left empty [], signifying that the data fetching should occur only once after the component mounts.
- The fetchRecipie function is an asynchronous function responsible for handling the API interaction. This function likely utilizes the axios.get method to make a GET request to a predetermined API endpoint, the exact URL construction of which depends on a recipeId retrieved from somewhere else in the code (not shown in the snippet).
- The code snippet employs the .then method, whichischainedtotheaxios.getcall,tohandlea successfulresponsefromtheAPI.Insidethe.thenblock,thecoderetrievesthefirstrecipefrom the data.meals array in the response and updates the React component's state using the setRecipiefunction.Thisfunction,associatedwiththeuseStatehook,allowsformodificationof the recipie state variable. By calling setRecipie(response.data.meals[0]),thecomponent'sstate is updated with the fetched recipe data, effectively making it available for use throughout the component.
- An optional error handling mechanism is incorporated using the .catch block. This block is
 designed to manage any errors that might arise during the API request. If an error occurs, the
 .catch block logs the error details to the console using the console.error method. This
 rudimentary error handling mechanism provides a waytoidentifyandaddresspotentialissues
 during the data fetching process.

UserInterfacesnips:

Herocomponents

•

Theherocomponent of the application provides a brief description about our application and a button to view more recipes.

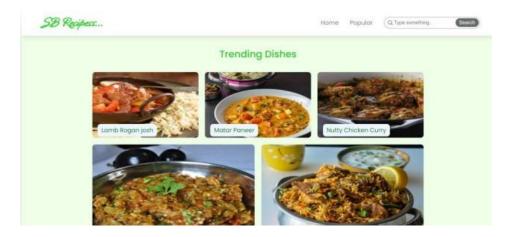

> Popularcategories

This component contains all the popular categories of recipes..

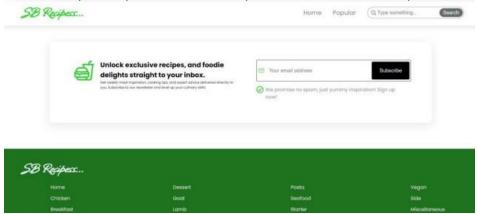

> Trending Dishes

This component contains some of the trending dishes in this application.

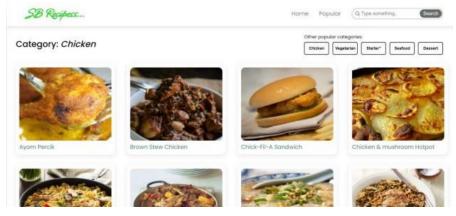

➤ NewsLetter

 $The new sletter component provides an email input to subscribe for the recipe \ new sletters.$

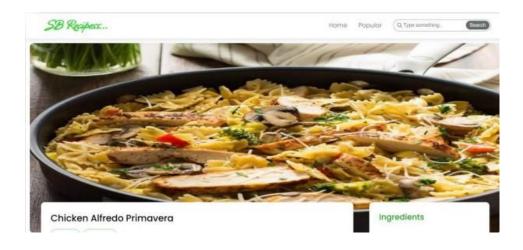

> Categorydishes page

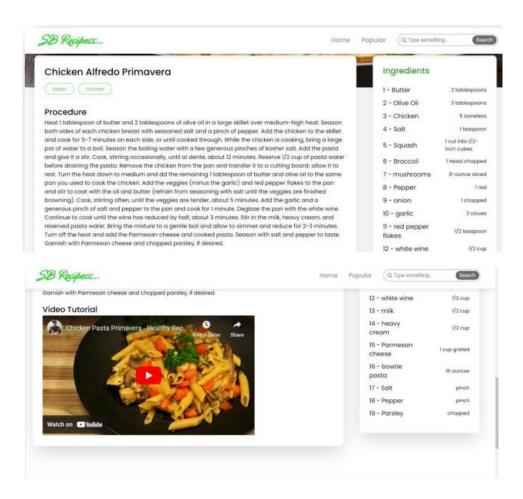

The category page contains the list of dishes under a certain category.

> Recipepage

Theimagesprovidedbelowshowstherecipepage, that includes images, recipe instructions, ingredients and even a tutorial video.
